

User name change error

Had an "unrecognized user name" error when I changed a test user name via admin panel and then tried to log in.

Logged in fine with email.

I'd changed my personal account name from the keycloak created hash without issue, so maybe issue is that the admin did it in this case? Or maybe I screwed it up, haven't tried to replicate.

ACL Strategy

Permissions can be overridden for specific Shelves/Books/Chapters/Pages, and they do inherit, but overrides are per defined role, so if many roles exist, there's a need for nearly redundant sets of overrides for each role.

1st SSO login issue

Mobile Breadcrumbs

Mobile breadcrumbs are just icons, and kinda mushy. Might be nice to have Book name, even truncated with ... ~LP

Adding CSS or content based on page tags

Interesting tip that could be used during an import process, or also to add hero banners or something to specific tags.
